Our paravane is a valuable addition to a response package for deploying booms or our Fasflo advancing skimmers.

A paravane is often referred to as a water kite. It is attached to the boom and powered by the water to slow and steady the boom replacing a tow boat.

The Vikoma paravane is a powerful and versatile tool. In a river deployment Paravane Mini can be used alongside personnel to manually deploy a boom system without the need for a boat. This functionality minimises personnel and reduces costs, making it ideally suited to training exercises as well as oil spill response.

Paravane Mini has a single vane arrangement and is suited to small to medium boom systems in rivers and sheltered waters.

Paravane Mini is designed to be hand carried to a location and can be quickly assembled for use. Afterwards, it can be de-assembled, making it easy to transport and store.

In a traditional open water boom deployment, Paravane also replaces the tow boat, enabling a single vessel to deploy a boom.

For this application we offer our larger paravanes which have a unique modular design offering ultimate flexibility. We offer interchangeable options for conversion allowing Paravane Maxi to be converted to a Midi and Paravane Midi to be converted to a Maxi. This gives you a really cost effective and flexible tool to easily convert to the size you need at the time of a spill.

Product benefits:

- Replaces tow boat
- Lightweight Aluminium for easy handling
- Reduces costs and personnel for a deployment
- Environmentally friendly solution using the power of water and no fuel
